Genius Project manages everything

Project management is complex, but Genius Inside tames the task with its feature-rich Genius Project, a portfolio project management solution sold in the “software as a service” model. If you need a capability to plan and manage a project, you’ll find it here, from task dependencies to Gantt charts to templates to budget management.

The program easily handles massive amounts of data, allowing you to drill down to details or gain a quick visual overview. It’s also fully searchable, and you can zoom in and out of views.

One of our favorite features, resource management, lets you search for team members based on skills and see their availability. When one team member is overloaded, you can drag and drop a task to another, with automatic e-mail notification for both members. The

matrix planning feature lets project managers and department managers work together through a process of reviewing resource reservations.

Genius Project even lets you create a document repository and set access rights to allow others to view and/or edit files. You also can import and export data with Microsoft Project.

Cost: \$42 per month per user, based on 50 users per year. An Express version, \$30 per user per month, lacks some of the features, such as multicurrency budgeting and expense tracking, the workflow engine, and document template. The prices include 1GB total or 20 MB per license, whichever is greater. Learn more at www.geniusproject.com.
